DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 10/03/05 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 26, 27, and 34, are rejected under 35 U.S.C. 102(b) as being clearly anticipated by US/6,317,322 to Ueki et al., (Ueki).

Regarding claim 26, Ueki disclosed (Fig. 9) an electronic device comprising: an electronic part or die (52) joined to a heat spreader (50) joined to a heat sink (51), wherein said heat spreader (50) comprises a sealed structure (501) encapsulating a condensable fluid therein which can repeatedly evaporate and condense to transport heat; wherein said electronic device

Art Unit: 2835

comprises means for joining the die or electronic part (52) to the heat spreader (50) (i.e. thermal grease (column 2, line 58)) so that thermal stress that causes separation of the die or electronic part (52) and the heat spreader (50) does not occur (inherently, since the Ueki device is designed to withstand the stresses and not to fall apart).

Regarding claim 27, Ueki disclosed that the die or electronic part (52) and heat spreader components (50) are selected to have <u>about</u> the same coefficients of thermal expansion such that they do not generate thermal stress sufficient to separate the die or electronic part (52) and the heat spreader (50) (inherently, since the Ueki device is designed to withstand the stresses and not to fall apart).

Regarding claim 34, Ueki disclosed that said electronic part (52) is a semiconductor chip (see column 2, lines 26-31), thus it inherently comprises silicon.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 35-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ueki taken alone.

Regarding claims 35 and 36, Ueki disclosed all, but that the heat spreader is made of the aluminum nitride or invar having specific ingredients (i.e. Mn, C, Ni, and Fe) and specific ratios

Art Unit: 2835

of said ingredients (.4%, .2%, 36%, and 63.4%, respectively). The Official Notice is taken of the fact that aluminum nitride and invar having said ingredients have been notoriously known in cooling art at the time the invention was made as good materials for making heat conductive components of cooling systems and said ingredients were commonly used for making the invar at the time of the invention, thus it would have been obvious to a person of ordinary skill in the cooling art at the time the invention was made to select aluminum nitride or invar having aforementioned claimed ingredients for making the heat spreader of Ueki in order to achieve desired coefficient of thermal expansion of said heat spreader and desired rate of heat dissipation, since it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416.

Regarding the specific claimed ratios of the invar ingredients, these ratios are the result effective variables, wherein the result is a coefficient of thermal expansion of the heat spreader.

It would have been obvious to one having ordinary skill in the cooling art at the time the invention was made to select any appropriate ratios of said ingredients, including as claimed, in order to achieve the desirable coefficient of thermal expansion of the heat spreader, since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

Regarding claims 37 and 38, claims recite the way the electronic device is employed, i.e. that said electronic device is an MPU or an image processor. The Examiner would like to direct the Applicant's attention to the fact that the way said electronic device is employed does not affect the structure of the device. The cooling arrangement still would be the same, whether said

Art Unit: 2835

device is an MPU, image processor, CPU, or any other heat producing component. What is important is only the fact that said component is producing the heat, which needs to be dissipated.

It would have been obvious to a person of ordinary skill in the electronic and cooling fields of endeavor to use the disclosed cooling arrangement of Ueki in conjunction with any electronic device in order to dissipate heat produced by said device and in order to satisfy the requirements of a particular specific application, since it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitations. *Ex parte Masham*, 2 USPQ2d 1647 (1987).

Response to Arguments

6. Regarding the Election/Restriction, the request for the formal rejoinder will be considered upon allowance of the parent claim 26.

Regarding the art rejection, the gist of the Applicant's arguments is that, allegedly, Ueki teaches that the electronic part (die) (52) and the heat spreader are <u>not</u> joined together (see p. 6, lines 16+) of the Amendment). This is not the case. How these components are not joined together, if they constitute a cooling arrangement (i.e. a finished device, an article, etc.) as presented on Fig. 9? Had these components were not joined together, as alleged by the Applicant, the structure would fall apart. Of course this is <u>not</u> the objective of any reasonable designer. All components of the Ueki structure, including the electronic part (die) (52) and the

Art Unit: 2835

heat spreader, are inherently joined together. Regarding the coefficient of thermal expansion, as presented in the rejection above, the electronic part (die) (52) and the heat spreader are inherently have <u>about</u> (as claimed) the same coefficients of the thermal expansion. The Applicant's argument that the keyword search of the Ueki disclosure did not produce any words "coefficients" and "separation" is not persuasive. The express, <u>implicit</u>, and <u>inherent</u> disclosures of a prior art reference may be relied upon in the rejection of claims under 35 U.S.C. 102 or 103. "The inherent teaching of a prior art reference, a question of fact, arises both in the context of anticipation and obviousness." *In re Napier*, 55 F.3d 610, 613, 34 USPQ2d 1782, 1784 (Fed. Cir. 1995).

In view of the above, the rejection of the claims is believed to be appropriate and is hereby maintained.

Conclusion

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Anatoly Vortman whose telephone number is 571-272-2047. The examiner can normally be reached on Monday-Friday, between 10:00 am and 6:30 pm..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ms. Lynn Feild can be reached on 571-272-2092. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
